

TypeAct

Simulate real-time typing during your demos.
Type a short trigger and the text appears character by character.

■ Installation Guide · macOS

■ PACKAGE CONTENTS

File	Description
INSTALLA.command	Automatic installer — run once
avvia.command	Starts the script — run before each demo
gestisci_snippet.html	Visual snippet manager (open with Chrome)
GUIDE.html	Interactive visual guide (open with Chrome)
snippets.json	Snippet configuration and speed settings

■ INSTALLATION — ONE-TIME SETUP

1 Download and unzip the package

ONCE

Anywhere on your Mac — e.g. in your Documents folder

- 1 Click the GitHub link shared by your colleague
- 2 Click **Code** → **Download ZIP**
- 3 Open the .zip — macOS will unzip it automatically
- 4 Move the **TypeAct** folder wherever you like (e.g. Documents)

■ Keep the folder in the same place. If you move it after installation you may need to repeat step 2.

2 Run INSTALLA.command

ONCE

Installs the required dependency and prepares the files

- 1 Open the **TypeAct** folder
- 2 Double-click **INSTALLA.command**
- 3 If macOS shows "unidentified developer": **System Settings** → **Privacy & Security** → **Open Anyway**
- 4 Wait for the script to finish — System Settings will open automatically

■■■ The script will automatically open the Accessibility panel. Do not close System Settings — continue with Step 3.

3 Grant Accessibility permission to Terminal

REQUIRED

Required — without this TypeAct cannot simulate keyboard input

- 1 In System Settings click **Accessibility** in the left panel
- 2 Click the **lock** ■ at the bottom left and enter your Mac password
- 3 Click the **+** button to add a new app
- 4 Navigate to **Applications** → **Utilities**, select **Terminal** and click **Open**
- 5 Make sure the toggle next to **Terminal** is **enabled (green ●)**

■■■ If Terminal is already in the list but the toggle is off, enable it. If TypeAct still doesn't work, remove Terminal from the list, add it again, then restart avvia.command.

4 Customise your snippets

RIGHT AFTER

Set up the texts you want to appear during your demos

- 1 Open **gestisci_snippet.html** with **Chrome** (right-click → Open with → Chrome)
- 2 Click "**Open snippets.json**" and select the file in the TypeAct folder
- 3 Add, edit or delete snippets using the visual interface
- 4 Press **■S** to save — changes take effect on the next launch

■ Snippets are personal: each team member has their own snippets.json. Use simple triggers like /1, /2, /3 or /question1, /case1, etc.

A Before the demo: start the script

EACH DEMO

Keep this running for the entire demo session

- 1 Double-click **avvia.command** — a Terminal window opens
- 2 You should see your loaded snippets listed ✓
- 3 **Minimise** the window — never close it during the demo

■ The Terminal window must stay open for the whole demo. You can minimise it freely.

B During the demo: type the trigger

IN USE

Works in any app — Slack, browser, Teams, PowerPoint, etc.

Trigger	Testo che appare
/1	Hi! I was looking for information about your product — can you help me?
/2	What are the lead times for a custom order?
/3	Your custom snippet text here...

■■ Click in the text field of any app (e.g. a Slack chat), then type the trigger. The script will delete it and type the full text character by character.

■ FREQUENTLY ASKED QUESTIONS

The script doesn't respond when I type the trigger

Check that Terminal has the Accessibility permission enabled (Step 3). If you added it but it still doesn't work, remove it and add it again, then restart avvia.command.

macOS says "unidentified developer"

This is normal for unsigned .command files. Go to System Settings → Privacy & Security, scroll down and click Open Anyway next to the file.

Does it work on Windows?

No, TypeAct is designed for macOS only. The Accessibility API it relies on is specific to macOS.

How do I add new snippets?

Open `gestisci_snippet.html` in Chrome, load your `snippets.json`, add the snippets you want and save with **■S**. Restart `avvia.command` to load them.

Does it work with Slack, Teams, the browser?

Yes — it works in any app where you can type text: Slack, Teams, Chrome, Safari, PowerPoint, Word, and more.
